

Inertsil PREP Columns

Inertsil PREP packing materials are dedicated to preparative applications. The semi-prep columns (6mm I.D.) have identical separation characteristics to preparative columns (50 and 100mm I.D.) due to the high performance packing process used by GL Sciences.

This permits a smooth change from a 6mm I.D. column, used to establish operating parameters, to a larger preparative column, if the same linear velocities are employed.
